

Hello,

My name is Serge and I'm an Angular developer with AWS full-stack skillset. I've been a front-end developer professionally for 5 years and been in the software development space close to 10. I'm currently working at Inovalon, it's an enterprise level healthcare software development company and I've been working here for 2.5 years now. I like working here, especially with my teammates and stack which is Angular + AWS.

Besides Inovalon, my core experience was at a startup called drugviu.com. There I was a lead Angular developer and I specialized in responsive web design and mobile first approaches using Bootstrap, Flexbox, and Angular Material. In addition, I did a lot of async REST API work with Angular services, routers, components, templates and forms.

In addition to front-end I understand and am competent working with backend developers. A lot of my work at both drugviu and kapitalex was developing middleware RESTful CRUD API calls to DynamoDB or Postgres using NodeJS/Express inside Amazon EC2 instances or Lambda functions. I am a big fan of the AWS serverless architecture.

I'm confident I'm a great candidate for this position because I have a passion for developing intuitive, interactive, accessible, flexible, and dynamic components for users to enjoy.

My portfolio is at <https://serge.link>

My career goal for 2025 is to complete the AWS Certified Developer Certification.

Sincerely,
Serge U.
