

Hello,

My name is Serge and I'm a Senior Software Engineer specializing in Angular + AWS.

I'm primarily an Angular Developer. Angular is by far my biggest strength and is something I enjoy working on the most. At the same time I've been using AWS for over 10 years. I'm into building responsive, intuitive, user friendly, asynchronous, and button workflow heavy, frontend applications. I specialize in Angular but I'm capable of working across frontend, backend, cloud infrastructure, and deployment workflows.

In my last position at Inovalon I worked with enterprise healthcare UI dashboards and complex async data workflows used by national health plans. My role included Angular architecture decisions, REST API integration, UI performance optimization, deployment coordination, and collaboration between cloud, data, and product teams.

This year I'm studying for the AWS Certified Developer exam and I'm working on personal projects. I've made githubcanvas.com, a full-stack SaaS web app built with Angular, AWS Lambda, DynamoDB, API Gateway, GitHub Actions, and OAuth authentication.

My strengths are a frontend specialization tied with an end-to-end engineering mindset. I enjoy building systems that can be rapidly prototyped, deployed, automated, iterated on, and scaled across the stack.

My portfolio is at: serge.link

Thank you for reading my cover letter.

Sincerely,
Serge Urakhchin
