

Hello,

My name is Serge Urakhchin, and I'm a Full Stack Engineer specializing in Angular, AWS, and cloud-native web applications.

Over the past several years, I've worked in enterprise healthcare platforms, building scalable UI systems, REST APIs, deployment pipelines, and serverless architectures. My background started with Angular, but over time evolved into full-stack ownership across frontend, backend, cloud infrastructure, and deployment workflows.

In my last position at Inovalon as a Senior Software Engineer, I worked on enterprise healthcare dashboards and complex async data workflows used by national health plans. My role included Angular architecture decisions, REST API integration, UI performance optimization, deployment coordination, and collaboration between cloud, data, and product teams.

This year I built githubcanvas.com, a personal full-stack SaaS project built with Angular, AWS Lambda, DynamoDB, API Gateway, GitHub Actions, and OAuth authentication that turns GitHub contribution graphs into an interactive art canvas. Building the platform end-to-end strengthened my interest in cloud systems, automation, and practical product engineering.

My strengths are a frontend specialization paired with an end-to-end engineering mindset. I enjoy building systems that can be rapidly prototyped, deployed, automated, iterated on, and scaled across the stack.

My portfolio is at: [serge.link](#)

Thank you for reading my cover letter.

Sincerely,
Serge Urakhchin
